Part 4: Short Talk Questions (2%)

Listen to the following paragraph and answer the questions.

When we have a cold, we often feel hot because of a fever. A fever is an increase in the body's temperature and is one of the main symptoms of the common cold. Some research suggests that the body heats up to prevent the cold virus from spreading. This theory is supported by a 2016 study from Yale University, which showed that viruses have difficulty multiplying when body temperatures are higher. Many people believe it's helpful to do things to make the body warmer when sick. For example, your nose will feel less blocked after taking a hot bath. While these actions may make us feel better, there's no proof that they'll help us recover faster. (12 Unit 8) #C

- (A) 8. What is said about a fever? #11
(A) It's a symptom of the common cold.
(B) It's a decrease in the body's temperature.
(C) It's the reason we feel cold when sick.
(D) It rarely happens when we have a cold.
- (D) 9. According to the passage, why do our bodies heat up? #12
(A) To keep viruses alive in the body.
(B) To help the body absorb medicine faster.
(C) To increase appetite when ill.
(D) To prevent the cold virus from spreading.
